EXP 1 - BAD AND GOOD UI

Aim:

To analyze and compare **Bad User Interface (Bad UI)** and **Good User Interface (Good UI)** designs of a Student/College Portal and understand how proper UI design improves usability and user experience.

Procedure:

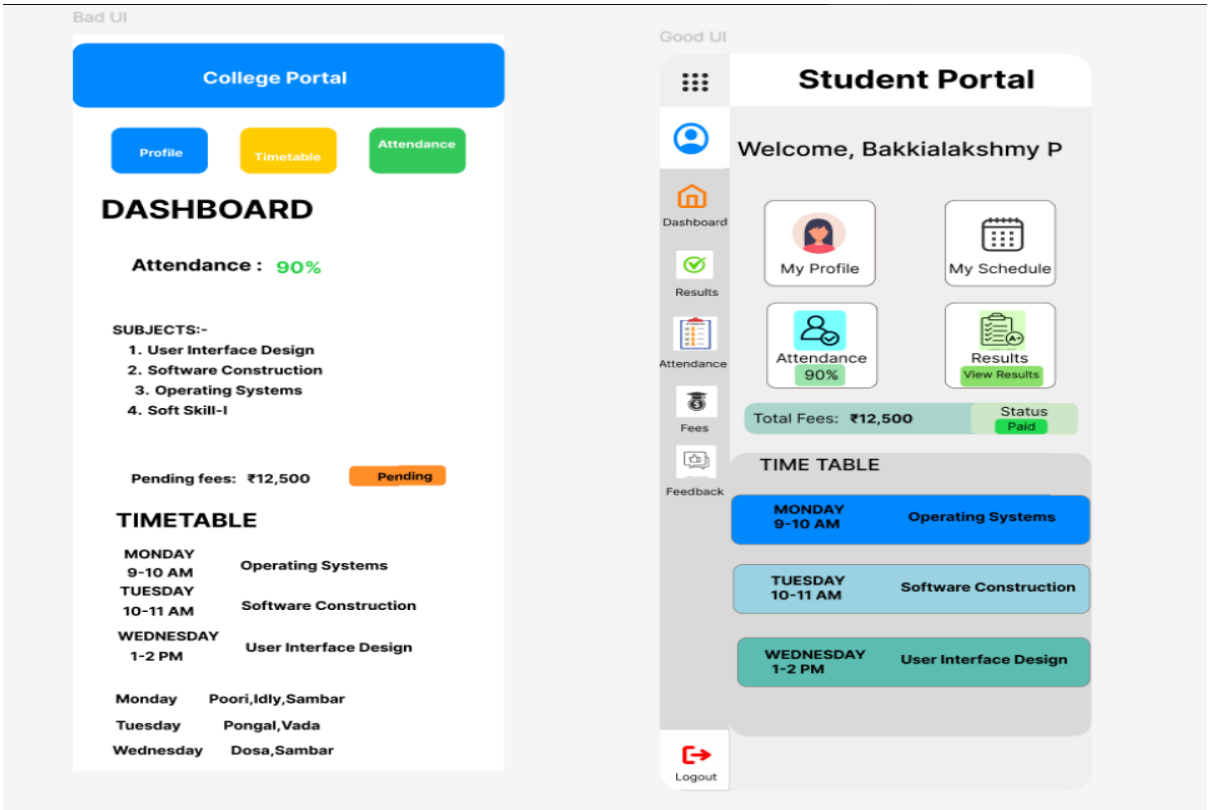
1. Identify a sample application interface, in this case a **Student/College Portal**.

2. Design a **Bad UI layout** where information is poorly organized, navigation is limited, and the interface lacks proper visual structure.

3.Design an improved **Good UI layout** using proper UI design principles such as:

- Clear layout structure
- Visual hierarchy
- Icons and cards
- Proper navigation system

Design Image:



Observation:

The interface design of the College Portal was analyzed by comparing a **Bad UI design** with an **Improved Good UI design**. The goal was to understand how proper user interface principles improve usability, clarity, and user experience.

1. Layout Structure

In the **Bad UI**, the layout is poorly structured. Information such as subjects, attendance, fees, timetable, and even food menu are all placed in a single continuous page without clear grouping. This makes the interface look cluttered and difficult to scan.

In the **Good UI**, the layout is properly structured using cards and sections. Important features like **Profile, Schedule, Attendance, and Results** are displayed as separate blocks, which makes navigation easier and visually organized.

2. Navigation

In the **Bad UI**, navigation options are limited and placed only at the top with simple buttons. Users may find it difficult to quickly access different sections.

In the **Good UI**, a **side navigation bar** is provided with icons such as Dashboard, Results, Attendance, Fees, and Feedback. This allows users to quickly switch between different features.

3. Visual Hierarchy

The **Bad UI** does not clearly highlight important information. All text appears similar in size and style, making it difficult for users to identify important data.

The **Good UI** improves visual hierarchy by using:

- Icons
- Card layout
- Color highlights
- Section headings

This helps users quickly identify important details like **attendance percentage, fees status, and timetable**.

4. Information Presentation

In the **Bad UI**, information is presented mainly as plain text lists. For example, the timetable and subjects appear as simple text without visual separation.

In the **Good UI**, information is presented using **cards and colored sections**, which improves readability and makes the content more user-friendly.

5. Feedback and Status Indicators

In the **Bad UI**, status information like fees appears as simple text ("Pending") without strong visual indication.

In the **Good UI**, status indicators such as **Paid** and **Attendance 90%** are highlighted with colors and labels, helping users quickly understand their status.

6. User Personalization

The **Bad UI** does not personalize the interface for the student.

The **Good UI** includes a welcome message such as **"Welcome, Bakkialakshmy P"**, which creates a more personalized and user-friendly experience.

7. Overall User Experience

The **Bad UI** looks cluttered and lacks clear navigation, which may confuse users.

The **Good UI** is visually organized, interactive, and easy to navigate, resulting in a better user experience.

Result:

The comparison shows that **Good UI design improves usability, readability, and navigation**. A well-structured layout, proper use of icons, and clear sections help users access information quickly and efficiently.
